

# WS933

## Cable Marking Machine

The WS933 is the third generation of servo driven cable markers, designed to print progressive measurements and legends in steps of one meter or two feet, at high speed and with extreme accuracy of print interval. Robust construction ensures rigidity, which is the first requirement of high speed marking. Marking wheels of one meter and two feet are quickly interchangeable, to minimise down time. Fine length scale adjustments can be made on the run in increments of 0.2mm (.008 inch).

The comprehensive control panel includes the following features of primary interest: -Display of progressive total length throughput.

-Marking wheel temperature.

-Interval length scaling, metres or foot-age.

Power ON, emergency stop, alarms/alarm mute and other necessary controls.

As well as the progressive length numbering unit, the marking wheel of the WS933 has a full circumferential die locking facility for printing additional information.

Unique W & S cages accept single die segments for printing variable legends.

Electro-pneumatic power enables the marking wheel to be swiftly raised and lowered to the pre-set marking position.

Supporting guide rolls are multi grooved to suit a range of cable diameters, and are provided with vertical and lateral adjustment.

The dual driven marking foil feed system can be built to suit any size of bobbin or foil pack.

Low state warning ensures continuity of foil feed.

An accumulator maintains foil in suspension, to ensure snatch free feed to the marking wheel.

Used foil is fed via a venturi take-off system into a filtered twin bag collection unit. As one bag fills a hand lever throw valve diverts foil into the empty bag.
